1. Introduction

Educational institutions receive numerous IT support requests every day from students, teachers, and staff. These requests include issues such as Wi-Fi connectivity problems, projector failures, password reset requests, and slow computer performance.

Traditionally, IT support staff manually review each ticket and assign the appropriate Category and Subcategory before processing the request. This manual approach consumes time, increases workload, and may result in classification errors.

This project implements an automated ticket classification system using ServiceNow Flow Designer. The solution automatically analyzes keywords entered in the Short Description field and assigns the appropriate Category and Subcategory without human intervention.

2. Problem Statement

The school IT helpdesk receives multiple incident requests daily from students and teachers related to network issues, hardware failures, access problems, and system performance concerns.

Currently, IT staff manually review each request to:

Identify the issue type.

Select the correct Category and Subcategory.

Inform the user about ticket creation.

3. Objectives

The main objectives of this project are:

Automatically classify incidents during ticket creation.

Reduce manual effort for IT support agents.

Improve ticket routing efficiency.

Ensure consistent ticket categorization.

Improve service quality and response time.

Create a scalable and maintainable ticket management process.

4. Scope

This project focuses on automating the classification of IT support tickets within a school environment.

The system covers:

Network-related issues

Hardware-related issues

User access problems

Performance-related issues

Automated email notifications

Ticket categorization and routing

The solution can be extended in the future to support additional ticket categories and advanced automation.

5. Technologies / Components

Component	Purpose
ServiceNow Platform	Application Development
Flow Designer	Workflow Automation
Custom Table	Store Ticket Records
Choice Fields	Category & Subcategory Management

6. Functional Requirements

The system must:

- Automatically classify tickets based on issue descriptions.
- Assign both Category and Subcategory.
- Support dependent choice relationships.
- Store ticket information in a structured format.
- Ensure data consistency.

7. System Workflow

- 1.User creates a new ticket.
- 2.Flow Designer is triggered.
- 3.Short Description is analyzed.
- 4.Keywords are matched.
- 5.Category and Subcategory are assigned automatically.
- 6.Ticket record is updated.
- 7.Email notification is sent to the caller.

8. Implementation Steps

Create Update Set.

Create Custom Table.

Configure Auto Number.

Create Required Fields.

Configure Choice Values.

Configure Dependent Choice Fields.

Create Flow Designer Flow.

Configure Trigger Conditions.

Implement Classification Logic.

Configure Email Notification.

Activate Flow.

Test and Validate the Solution.

9. Advantages

Reduces manual effort.

Faster ticket processing.

Improves accuracy.

Ensures standardization.

10. Limitations

Keyword-based classification may not recognize complex issues.

Incorrect spelling may affect classification accuracy.

Limited to predefined categories.

11. Conclusion

The Auto Ticket Classification using Flow Designer project successfully automates the categorization of IT support tickets. By utilizing ServiceNow Flow Designer, the system automatically identifies issue types and assigns the appropriate Category and Subcategory.
